**Re: May 31, 2006 Letter of Violation to Double Eagle Steel Coating Company:  
MID981092190**

Dear Mr. Day:

With this letter, Double Eagle Steel Coating Company ("DESCC") responds to MDEQ's May 31, 2006 letter alleging violations of hazardous and liquid waste management requirements. This letter responds to each of the issues raised in your correspondence, in the order they were presented.

**Alleged Violation 1: Waste Characterization**

Your letter alleges that the waste characterizations provided are inadequate to ensure appropriate characterization of four listed waste streams. While DESCC agrees that it has an obligation to characterize certain waste streams in accordance with Rule 299.9302(1) and 40 CFR 262.11, DESCC believes that is in compliance with this requirements. Briefly, DESCC is required to determine whether a waste stream is a listed hazardous waste, and if not, to determine if it is characteristically hazardous based on testing of the material and/or application of knowledge of the hazardous characteristics in light of the materials or processes at issue. Relevant to the four listed waste streams, none of which are listed hazardous wastes, DESCC's characterization of the materials are based on a combination of analytic testing of the material and DESCC's knowledge of the materials and processes at issue. The applicable rules do not impose any time frame on the validity of past analytical data, where generator knowledge demonstrates that there have not been any relevant changes in the waste stream at issue.

Specifically, DESCC has used its knowledge of the consistency of the processes that generated these materials to conclude that the most recent analytical data continues to be valid. Since DESCC processes have been constant, there is no reason to expect that the characteristics of the waste streams and byproducts created by DESCC's processes have changed. Additionally, whether the materials are sent off-site for reuse, recycling or

disposal, they are subject to testing, and are checked by the recipients of the material. While DESCC does not rely on such third-party testing to make its initial determination as to whether a type of waste is hazardous under Rule 299.9302, this testing serves to confirm its application of its general knowledge to characterize the waste streams. DESCC believes that it may use such third-party testing as a valid check on DESCC's conclusions about the consistency of its processes and the wastes or materials generated thereby.

Regarding the four specific waste streams identified in your letter:

1) Tank 12 caustic: analytic data on the caustic was submitted with our April 28, 2006 letter. Based on DESCC's knowledge of its processes, this material has remained constant since the analytic data was taken. Accordingly, DESCC does not believe that further characterization of the material is required at this time. However, as a courtesy, and to the extent DESCC understands your letter to be a request for DESCC to voluntarily re-characterize the caustic material, DESCC intends to confirm its characterization as follows. DESCC proposed to test the material by taking samples from the tank unloading valve and having the samples analyzed for Michigan Eight Metals (TCLP), reactivity, corrosivity, and ignitability.

2) Tank 43 and 44 used oil: Tanks 43 and 44 contain used oil, and liquid from these tanks is sent off-site as used oil. As such, DESCC understands this material to be subject to used oil regulations, and not hazardous waste regulations per se. Copies of used oil profiles for this material were enclosed with our April 28 response. Based on DESCC's knowledge of its processes, the material collected in Tanks 43 and 44 has remained consistent. However, as a courtesy, and to the extent DESCC understands your letter to be a request for DESCC to voluntarily re-characterize the used oil, DESCC intends to confirm its characterization as follows. DESCC proposed to test the material by taking samples from the tank unloading valve and having the samples analyzed for Michigan Eight Metals (TCLP), reactivity, corrosivity, and ignitability.

3 & 4) Filter Cake: The May 31 letter has restated your request for characterization of filter cake produced by DESCC's zinc and alloy electro-galvanizing processes. Your letter approaches filter cake produced from zinc electro-galvanizing as a different waste stream than filter cake produced by alloy electro-galvanizing. In fact, there is really only one filter cake waste stream. The filter cake at issue is generated in the plating solution filter press. The same filter press is used regardless of whether zinc or alloy galvanizing is being performed. The characterization previously provided (Exhibit L to our April 28<sup>th</sup> letter) is applicable to the entire filter cake waste stream, and does not need to distinguish between zinc or alloy processes. Based on DESCC's knowledge of its processes, the relevant character of the filter cake has remained constant and this characterization remains valid. However, pursuant to your request, DESCC will have its characterization of the filter cake confirmed through separate testing of filter cake generated during zinc plating operations and filter cake generated during alloy plating operations.

For all material to be characterized, DESCC will wait at least 30 days before performing such characterization, to allow time for MDEQ's input or suggestions as to the proposed testing. This 30 day period is in response to the request in your letter for a 30 day time period for MDEQ review of planned sampling and waste analysis activities at DESCC.

#### Field Screening and Waste Determination Issues

Your letter, in the third paragraph on page 2, references DESCC Procedure S-01-59-10 and interprets that procedure as calling for pH field screening of the spent caustic bath. This same paragraph also identifies DESCC as asserting that a waste hauler makes the determination as to whether hazardous waste is managed as a hazardous waste or sent for beneficial reuse. Both of these interpretations of DESCC letter and procedures are incorrect.

First, procedure S-01-59-10 addresses material in the secondary containment area for Tank 12, not the material in Tank 12 itself. It is the liquid in the containment area, (primarily precipitation) under DESCC's current operating practices, that is pH tested.

Second, regarding the off-site shipment of caustic for beneficial reuse, that occurs only with the caustic from Tank 12. It does not occur with liquid removed from the containment area. All of the caustic material removed from Tank 12 is sent to Dynecol for beneficial reuse. Typically, there is no determination made when the material is removed from Tank 12, rather it is simply sent to Dynecol for beneficial reuse. As noted in our prior letter, on rare occasion Dynecol may advise DESCC that it cannot accept the material (due to a lack of need for the material) or if it does not meet Dynecol's specifications. Additionally, there have been a few instances where DESCC recognized that the oil content of a load of a caustic was too high to meet Dynecol's specifications. It is at this point in time that such material, which would otherwise be beneficially reused, becomes hazardous waste. It is handled as such from that point forward, including compliance with hazardous waste manifesting requirements. However, to be clear, at no point does anyone other than DESCC make a characterization determination for the material removed from Tank 12.

#### Waste Analysis Plan

Your letter requests that DESCC provide a Waste Analysis Plan (WAP). DESCC is surprised by this request, since WAPs are required only for facilities that treat hazardous waste. See, e.g., 40 CFR 268.7. Since DESCC is merely a generator and not a TSDF, we do not believe that we are required to have a WAP. Moreover, DESCC believes that its current waste management practices are sufficient to properly characterize any waste streams produced at DESCC.

#### **Alleged Violations 2 and 5 – Release of Hazardous Waste**

The first two paragraphs in your letter regarding alleged violations 2 and 5 address a number of concerns regarding DESCC's written operating procedures for management of the secondary containment area for Tank 12. While DESCC believes that its written

procedures are fully appropriate as currently drafted, DESCC is willing to revise the wording in the written procedures to address MDEQ's concerns, as discussed herein.

The first issue appears to be a concern that the Tank 12 Secondary Containment Dike Level Management procedures allows up to six inches of accumulated liquids in the Tank 12 containment area. We believe this is an incorrect reading of our procedure. We point your attention to the "Corrective Action" section of the procedure, which states that the contents of the containment area are to be removed within 24 hours anytime there is material in the area. However, we have again revised this procedure, in order to address your concerns and make this requirement even more specific. A revised copy of the procedure is enclosed with this letter, and included in Exhibit 1.

Your letter also expresses the concern that the Tank 12 Secondary Containment Dike Level Management procedure does not clearly state that dike levels and pH readings will be recorded on the monitoring spreadsheet. In fact, the directive for the recording of information on dike level and pH reading is imposed via procedure S-01-59-10. While these procedures are overlapping, DESCC does not believe it is necessary to make them entirely duplicative, so long as the essential requirements are set forth in one of the procedures.

The next stated concern is that procedure S-01-59-10 does not "document" various regulatory requirements, such as the protection of hazardous waste from vandals, etc. and the prohibition on hazardous waste escaping into the soil, sewers, etc. While DESCC acknowledges these regulatory requirements, DESCC believes this concern misunderstands the purpose of the written procedures. DESCC uses written procedures to instruct its operators as to what to do and how to respond to certain situations. In this regard, written procedures facilitate both compliance with applicable regulations and ensure proper operation of the many processes and activities associated with DESCC's business. However, written procedures are generally focused on what to do, and not so much on why to do it. Specifically here, our operators do not need a recitation of the regulatory standards. They just need to know what to do, and if the procedure is written properly, compliance with the procedure will ensure compliance with the applicable regulations. "Documenting" the various regulatory requirement in the procedure would merely clutter up the procedure, making it harder to read, understand and implement. Similarly, DESCC is not aware of any requirement in the regulations that a written procedure be drafted that recites that language of the regulations. Accordingly, DESCC does not intend to revise its procedures to recite the verbiage of the regulations.

However, to the extent that MDEQ is asking DESCC merely to modify the directions in procedure S-01-59-10 to clarify its requirements, DESCC is certainly willing to do so. Revised versions of the Tank 12 Secondary Containment Dike Level Management and S-01-59-10 Holding Tank 12 procedures are enclosed with this letter as Exhibits 1 and 2 respectively, and attempt to respond to the types of issues identified here.

Your letter references the requirements in 40 CFR 265.194 regarding use of controls and practices to prevent spills and overflows into containment areas. As set forth in

DESCC's April 28<sup>th</sup> letter, DESCC has a variety of practices and control equipment in place to verify the integrity of Tank 12 and the containment area, and to prevent overflows into the containment area. Specifically, in addition to the written procedures addressed herein, the Tank 12 system is designed with high level alarms and overflow protection. The high level alarm has been rehabilitated. It is being tested on a monthly basis to ensure that it continues to operate properly. A copy of the testing procedure and the associated reporting form that have been developed are attached as Exhibit 3. The high level alarm causes shut-off of the sandpiper (sump pump) units that collect liquids from the process area and automatically pump the liquid to Tank 12. This prevents liquid from the sandpipers from causing an overflow of Tank 12. Additionally, because liquids are also delivered manually to Tank 12, the relevant employees have been trained to avoid overfilling of the Tank.

Your letter also references the requirements in 40 CFR 265.196 regarding requirements if a leak or spill occurs in a tank system. While DESCC recognizes the potential applicability of 265.196 if a leak or spill were to occur at Tank 12, DESCC does not believe that these requirements have been triggered. The routing of overflow from Tank 12 into the containment area is an approved design element of the tank system. This was done for safety reasons in case of an excess amount of liquid in Tank 12. Should Tank 12 overflow into the secondary containment system, that is neither a leak nor a spill, and does not call into question the integrity of Tank 12. Section 265.196, though, is focused on tank integrity questions, with the goal of preventing use of unfit tanks. Here, the real question is management of Tank 12 to avoid any overflows into the containment area. Indeed, both the 1997 Chester Engineers report certifying Tank 12 (Exhibit A of the April 28<sup>th</sup> letter) and the current SME report (see below) both found the tank meets the provisions of Subpart J of the RCRA regulations regarding hazardous waste storage tanks. It is DESCC's goal that practices, procedures and control equipment will allow DESCC to avoid overflows of Tank 12 into the containment area.

Your letter also raises the question of the integrity of the Tank 12 system, in order to avoid releases of hazardous or liquid wastes into the environment. As promised in our April 28 letter, an independent professional engineer was engaged to review the integrity of Tank 12 and the Tank 12 containment system. This inspection was conducted in May, and a copy of the report of the inspection, from Soil and Materials Engineers, Inc. (SME), is enclosed as Exhibit 4. You will see the report makes several maintenance suggestions for the tank, as described in the report and listed together on page 4 of the Above Ground Storage Tank Audit section of the report. These maintenance items, seven in all, have all been addressed.

Finally, this section of your letter raises a question about the training given to the operators about avoiding overflows of Tank 12. You have requested documentation that operators understand that overflow of Tank 12 into the secondary containment is not allowed as a management method. Accordingly, DESCC has revised the training form enclosed as Exhibit E to the April 28<sup>th</sup> letter. A new form, which recognizes the enhancements to the Tank 12 management procedures is enclosed as Exhibit 5.

### **Alleged Violation 3 – Release Reporting**

Your letter alleges a failure by DESCC to notify MDEQ and other authorities of releases of material from Tank 12 into the Tank 12 secondary containment area. The complete answer to this allegation is that there were no violations of the cited notification requirements because there were no reportable releases involved in the discharge of caustic solution to the secondary containment of Tank 12.

The allegation indicates that there are both Federal and State issues involved. Each issue will be answered separately.

Federal Regulations. Michigan has adopted the Code of Federal Regulations relating to reportable quantity release notification. According to the rules adopted by the Michigan Environmental Response Division for Environmental Contamination Response Activity:

“For release reports made after the effective date of this rule, the requirements of section 20114(1)(b) of the act shall be based on reportable quantities of hazardous substances established under 40 C.F.R. §§302.4 and 302.6 (July 1, 2001), which are adopted by reference in these rules...”

MAC Rule 299.5117. “Release” is therefore defined as:

“Release means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing **into the environment...**”

40 CFR 302.3 (emphasis added). Please note that although the phrase “into the environment” was left out of the MDEQ letter of May 31<sup>st</sup> in describing what constitutes a release, the phrase is a key part of the definition.<sup>1</sup>

“Environment” is defined as:

“Environment means (1) the navigable waters, the waters of the contiguous zone, and the ocean waters of which the natural resources are under the exclusive management authority of the United States under the Fishery Conservation and Management Act of 1976, and (2) any other surface water, ground water, drinking water supply, land surface or subsurface strata, or ambient air within the United States or under the jurisdiction of the United States”

---

<sup>1</sup> Please note that the MDEQ web home page links to a document entitled “Release Notification Requirements in Michigan” at [www.deq.state.mi.us/documents/deq-ead-sara-releasetable.pdf](http://www.deq.state.mi.us/documents/deq-ead-sara-releasetable.pdf). This table confirms the use of the phrase “into the environment” when defining reportable quantity notification requirements in Michigan.

40 CFR 302.3.

The discharges from Tank 12 to the secondary containment around the tank did not reach "the environment" in that they did not reach 1) navigable waters, the waters of the contiguous zone, or the ocean waters of which the natural resources are under the exclusive management authority of the United States under the Fishery Conservation and Management Act of 1976; or 2) any other surface water, ground water, drinking water supply, land surface or subsurface strata of the United States.

As far as a release to the ambient air is concerned, it is obvious that an ambient air RQ would involve the release of either a gas, or material with a high rate of volatilization or sublimation, depending on whether the initial release involved a liquid or solid. This understanding is reinforced by the discussion found in the preamble to the final rule for 40 CFR 302, as published in the Federal Register:

Hazardous substances may be released "into the environment" even if they remain on plant or installation grounds. Examples of such releases are spills from tanks or valves onto concrete pads or into lined ditches open to the outside air, releases from pipes into open lagoons or ponds, or any other discharges that are not wholly contained within buildings or structures. Such a release, if it occurs in a reportable quantity (e.g., **evaporation of an RQ into the air from a dike or concrete pad**), must be reported under CERCLA.

50 FR 13456-01, Section IV(D)(2)(b) (emphasis added).

This clearly demonstrates that for a discharge to a dike or concrete pad to be considered a reportable release, there must be an evaporation of the material in question into the ambient air in a quantity equal to or greater than the RQ defined in 40 CFR 302.4 or 302.6. This was not the case with the material in Tank 12. The caustic material in Tank 12 is not a volatile substance, and there is no reason to expect evaporation of the caustic into the air in any measurable quantity, let alone in excess of the RQ.

To restate our position, based on this analysis of the Federal regulations, there was no reportable quantity released from Tank 12 to the environment, and therefore no requirement to notify the National Response Center, the Coast Guard, the MDEQ, or the state and local emergency response planning committees.

Michigan Regulations. In your May 31<sup>st</sup> letter, Michigan Rule 299.9306(1)(d) is cited as the basis for the allegation of a notification violation. This Rule reads as follows:

"(d) The generator complies with the requirements for owners or operators in 40 C.F.R. part 265, subparts C and D, and 40 C.F.R. §265.16 and 40 C.F.R. §268.7(a)(5). **If there is a fire, explosion, or other release of hazardous waste or hazardous waste constituents that could threaten human health or the environment, or if the generator has knowledge that a spill has reached surface water or groundwater, then the generator shall immediately notify the department's pollution emergency alerting system - telephone number**

800-292-4706. The notification shall include all of the following information: [list of information omitted]

A plain reading of the underlined section of the above quoted rule reveals several deficiencies in the argument that this rule required DESCSC to make any notifications. The underlined section clearly states several criteria that, if met, trigger notification. However, none of these criteria were met by the discharge of material from Tank 12 to the secondary containment around Tank 12, and thus the notification requirement was not triggered.

First, there was no fire or explosion at the site. Second, there was no spill to surface water or ground water. And finally, there was neither a release to the environment (as illustrated in the previous section of this response) nor a release of any type that could actually or potentially threaten human health or the environment. The nature of the material in Tank 12 is known to DESCSC and is handled safely on a routine basis by DESCSC. Since the material was held in secondary containment on a fenced and secured site, it did not pose an actual or potential threat to human health or the environment. None of the criteria laid out in the rule was met by the situation at Tank 12.

In summary, as concerning Tank 12 and the incidents in question, neither Federal nor State regulations required DESCSC to make any notifications to any local, state or federal agency.

#### Hydraulic Oil Spill Issue

In the "Violation 3" section of your letter, you also ask about the reference to a hydraulic oil spill in the spreadsheets listing non-hazardous waste shipments, attached as Exhibit N to our April 28<sup>th</sup> letter. In fact, the "hydraulic oil spill" entry references a spill of 35 to 40 gallons of hydraulic oil that occurred on January 5, 2006 when a waste hauling truck owned by Technical Logistics Co. of Romulus, Michigan suffered a failure of hydraulic oil hose while at DESCSC. The spill was reported to the NRC, MDEQ PEAS and the MDEQ Water Bureau. Copies of the follow-up written notices are enclosed as Exhibit 6. Cleanup of the spill involved power washing and vacuuming of the affected area. This activity generated some cleanup wash water; the cleanup contractors, Vac-All, now estimates that probably some 400 gallons of cleanup water would have been used. The wash water was disposed of with the spilled oil. Based on a discussion with Vac-All, used oil was likely taken from Tanks 43 and 44 in order to maximize use of the truck that hauled these wastes materials. The material from Tanks 43 and 44 comprised the remainder of the 2800 gallon waste disposal shipment.

#### Alleged Violation 4 – "Used Oil" labeling

Per your letter, no response is necessary on this issue.

#### Additional Alleged Violations

## **1. Tank 12 Inspections – Concrete Slab**

Your May 31<sup>st</sup> letter notes that Tank 12 is situated on top of a concrete slab, and charges that this situation prevents visual inspections of the bottom of the tank, and thus violates the daily inspection requirements of 40 CFR 265.195. Your letter requests that DESCC identify either changes in inspection procedures or modifications to Tank 12 to address this concern. Although DESCC disagrees that the current situation presents any violation of 40 CFR 265.195, we request your input on what changes in inspection procedure you believe would be appropriate to address this issue.

As to 40 CFR 265.195, this section requires daily inspections of hazardous waste tanks, including, as relevant here:

(a)(2) The aboveground portions of the tank system, if any, to detect corrosion or releases of waste;

(a)(4) The construction materials and the area immediately surrounding the externally accessible portion of the tank system including secondary containment structures.

Tank 12 does sit on a concrete slab. The concrete slab, which could be described as a pedestal, is elevated, so that the tank sits above the ground floor of the containment area, with the bottom of the tank resting on the slab about 4 feet above the floor of the containment area. As such, the top of the slab/pedestal and the circumference of the base of the tank are visible. Were there to be a leak of material from the tank through the bottom of the tank, the material would leak out from underneath the edge of the tank, onto the concrete pedestal. Were this to occur, the leaking material would be visible, and the leak would be identified during the daily inspections.

As it is, the situation of Tank 12 provides better visibility of the bottom edge of the tank than if the tank were placed on concrete slab flush with ground level, where rain or snow events would be more likely to obscure evidence of leaking from underneath the tank at ground level. For its part, the cited regulation, 40 CFR 265.195, only requires inspections of the visible portions of an aboveground tank, and of the area surrounding the tank. This regulation does not require that the entire surface of an aboveground tank be visible for inspection. Indeed, unless the tank were suspended in mid-air, it is hard to picture any situation where the entire exterior of the tank is visible for inspection. There has to be something underneath the tank to hold it up.

Accordingly, it is possible to conduct daily inspections that satisfy 265.195 with Tank 12 in its current configuration. As noted above, DESCC welcomes any suggestions as to inspection procedures to help assure MDEQ that appropriate inspections are and will be conducted.

## **2. Non-Hazardous Shipments of Liquid from Tank 12 Secondary Containment**

When material was removed from the secondary containment area for Tank 12, it was tested for pH to determine whether it was characteristically hazardous. Typically, the testing was done in the field, at the secondary containment. There is no concern that the material was listed hazardous waste, as it consisted solely of a mixture of precipitation and/or caustic from overflow of Tank 12. If the material tested as characteristically hazardous, it was disposed as hazardous waste. If not, it was disposed as non-hazardous liquid industrial waste. Additionally, there is no concern that any harm to the environment resulted from this practice, since the material, when shipped off as non-hazardous, was tested at the receiving disposal facility, Usher Oil. If they had found it to be hazardous, it would have been sent back to DESCC. Copies of the disposal manifests and Usher Oil testing sheets are enclosed as Exhibit 7.

DESCC has revised its recordkeeping procedures to ensure that testing of each shipment of material from the Tank 12 secondary containment area is adequately documented, and that such records are maintained for a minimum of three years.

### **3. Squirt Protection**

Your letter raises the question of adequate squirt protection for Tank 12. Currently, if a rupture of Tank 12 were to occur such that liquid from Tank 12 squirted from the Tank over the edge of the secondary containment area, it would most likely be contained by surrounding containment areas. On the north side of the tank, it would go to the containment area for Tanks 43 and 44. On the west side, it would go to the containment area for the truck loading/unloading area. On the south side, it would go to asphalt that drains to the truck loading area containment.

Thus, squirts to the north, west or south would be captured in an existing containment area. On the east side, a squirt would hit the external wall of the building, and fall into a narrow area between the Tank 12 secondary containment and the building. This area, which was previously gravel, has now been paved. There is a curb on one end of this area, which serves as a wall for the area. DESCC is considering the merits of adding a curb to the one open side of this paved area, to retain any material within this narrow paved area. However, paving the area presents logistical issues, such as the collection of rainwater. DESCC requests your input on this potential approach. DESCC would also appreciate it if you could identify any regulations that directly address the question of squirt protection; DESCC is not aware of any such regulations that establish a baseline for measuring the need for, or adequacy of, squirt protection, except for the requirement that containment be sufficient to protect "surrounding earth" that is "likely" to come into contact with waste if released from the tank. 40 CFR 265.193(e)(1)(iv). DESCC believes that the current configuration satisfies this standard.

This section of your letter also asks about the relining activities for the Tank 12 disposal area and the disposal of waste material generated by the relining project. As noted previously, a copy of the independent engineering certification of the relining is enclosed. All of the waste material created during the relining project was collected in a set of eight drums and was characterized. All of the material was characterized as non-hazardous.

Four of the drums have already been sent off-site for disposal. A copy of the waste characterization for the waste material and the disposal manifest for the first four drums are attached as Exhibit 8.

Finally, as a point of clarification, and just to ensure there are no misunderstandings, DESCC notes that your letter identifies one of General Acid Proofing bids, attached as Exhibit D to the April 28<sup>th</sup> letter, as calling for cutting out loose and damaged areas of the floor and removing deteriorated concrete at the Tank 12 containment area. This reference indicates that there is confusion between the August 11, 2005 proposal for relining activities at DESCC's tank farm (in Exhibit D to the April 28<sup>th</sup> letter) and the January 6, 2006 proposal for the relining of the Tank 12 secondary containment area (also included in Exhibit D of the April 28<sup>th</sup> letter). It is the first document, regarding the tank farm, that has a scope of work that includes repair of the damaged areas of floor and deteriorated concrete. Such work was not included in the proposal for Tank 12. This is obviously a minor point, but DESCC wants to make sure that there is no misunderstanding about the condition of the Tank 12 containment area prior to the recent relining.

**4. Labeling of Tank 12 with "Hazardous Waste" identifier.**

MDEQ has requested labeling of Tank 12 with the words "Hazardous Waste." While DESCC does not agree that Tank 12 contains hazardous waste, since the material in Tank 12 is sent for beneficial reuse, DESCC agrees that some labeling of Tank 12 is appropriate, since the caustic material would be hazardous waste if it were not beneficially reused. Accordingly, DESCC has put the following sign on Tank 12:

**NOTICE**

**CONTENTS IN THIS TANK NOT BENEFICIALLY REUSED  
MAY BE CLASSIFIED UNDER FEDERAL REGULATIONS AS**

**HAZARDOUS  
WASTE**

**SPIILLS, RELEASES AND DISPOSAL OF MATERIALS  
FROM THIS TANK MUST BE HANDLED ACCORDING TO  
MICHIGAN AND FEDERAL HAZARDOUS WASTE  
REQUIREMENTS.**

## 5. Spill Prevention Controls

Your letter requests identification of the period of time the high level alarm for Tank 12 was not functioning properly. DESCC is unable to identify the period of time that the high level alarm was not functioning properly. However, Tank 12 and the containment area have been subject to regular daily inspections and these served as a basis to recognize any situation where there had been an overflow of Tank 12 into the containment area.

The high level alarm is subject to monthly tests to ensure that it is functioning properly. According to the most recent testing of the high level alarm, it is currently functioning. DESCC believes that the current inspection protocol and the enhanced monitoring and recordkeeping procedures for the Tank 12 containment will ensure that the alarm continues to function properly and that any malfunctions are appropriately identified.

### Additional Clarifications

**Beneficial Reuse Issue:** Per your request, copies of bills of lading for shipments of caustic to Dynecol for beneficial reuse are enclosed. You requested copies of bills of lading from February 2005 through March 2006. Copies of bills of lading dating back through June 2005 were located, accordingly bills of lading from June 2005 through May 2006 are enclosed as Exhibit 9. We will supplement these documents with bills of lading dating back to February 2005 if additional bills of lading are located.

**Resolution of Exhibit C with Exhibit M:** Your letter raises several question about consistency between Exhibit C and Exhibit M. Initially, however, DESCC expects that you intended to reference Exhibit N, not Exhibit M, and we will respond accordingly.

Initially, as stated in our April 28 letter, Exhibit C is a listing of off-site shipments, for disposal, of material from the Tank 12 secondary containment area. These shipments contained a mixture of water (from precipitation) and overflow caustic from Tank 12, and would have been routinely checked for acceptable pH before arranging shipment to Usher. DESCC believes that if this material was not sufficient for a full load, it would be supplemented with used oil from Tanks 43 and 44. The liquid from the secondary containment, regardless of whether it had any added material from Tanks 43 and 44, falls within the scope of the waste approval from Usher Oil for used oil from Tanks 43 and 44, and would be shipped to Usher pursuant to that approval. As a result, although the engineer who recorded this information on the spreadsheet contained in Exhibit N is no longer with DESCC, it is believed that these shipments are listed on Exhibit N, albeit with the "source" merely identified as Tanks 43 and 44, as reflective of the waste approval being used for the shipment.

Your letter also asks a number of specific questions about the information in Exhibit N. DESCC will attempt to respond to each of the issues. As a preliminary matter, though, it should be pointed out that the spreadsheet provided in Exhibit N is used by DESCC as a

convenient summary of used oil shipments, and is not intended to replace the manifests themselves.

a. The 4/26/2005 shipment under Manifest 9509134 does not list the waste approval number. The correct number, for EQ Resource Recovery, is DO 06459.

b. The 1/9/06 shipment under Manifest 9509354 has the incorrect waste approval number listed. The correct number is 080805-0.

c. Your letter identified several waste approval numbers listed in Exhibit N which were not enclosed with our April 28<sup>th</sup> letter. DESCC is continuing to work on this issue. Investigation of this issue is complicated by the departure of Christopher McBee, DESCC's former environmental engineer who filled out the spreadsheets included in Exhibit N, and by the current departure of Marc Swientoniowski, an employee of Houghton Fluidcare who had been serving as a temporary replacement for Mr. McBee and is being rotated to a new position by his employer.

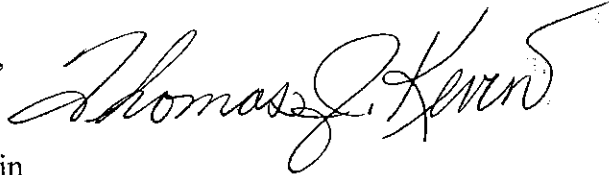

The waste approvals provided in Exhibit N were DESCC's current waste approvals. DESCC has determined that one of the waste approvals in question, K07502, from EQ Resources, expired in November 2005. That appears to be the reason K07502 was not included in Exhibit N. DESCC is continuing to work toward a complete response on this issue, and will provide it as soon as possible.

#### **Resolution of Exhibit C with Exhibit H**

Your letter questions why three hazardous waste shipments listed on Exhibit H were not included in Exhibit C. Exhibit C is a listing of shipments of material taken from the Tank 12 secondary containment area. Exhibit H is a listing of shipments of material sent from Tank 12 itself. Since the lists are different in scope, they do not list the same shipments. That is why the shipments listed on Exhibit H are not included in Exhibit C.

Please direct any inquiries regarding the foregoing responses to your May 31<sup>st</sup> letter to our environmental counsel, Scott Dismukes at 412-566-1999.

Sincerely,

Tom Kevin  
Plant Manager

## **Tank 12 Secondary Containment Dike Level Management**

**Area:** Tank 12 Secondary Containment Dike

**Unit:** Tank 12 Secondary Containment Dike

**Control Element:** Management of liquids held within the area

**Purpose:** To manage any liquids contained within the area through timely removal and disposal.

**Responsibility:** Environmental Engineer, Quality Lab, and WWT Lab

**Standard:** Any liquids collected in the containment area must be removed within 24 hours.

**Measurement Requirement:** Visual for dike, recorded in log book. pH of liquid to be recorded.

**Corrective Action:** Waste hauler must be contacted to remove contents of containment area. Removal is to be conducted within 24 hours. Determination of a treatment/disposal to be made by Environmental Engineer based on pH (>12.5) of material contained in the dike. Records of pH level recorded for each shipment of material sent off-site must be retained for a minimum of three years.

**Seriousness:** Critical

# **S-01-59-10**

## **Holding Tank 12 and Containment Area.**

### **EPN# LI042**

**AREA:** HCD CLEANER

**UNIT:** HCD Cleaner

**CONTROL ELEMENT:** Holding tank 12. EPN #LI042

**PURPOSE:** To hold Spent Cleaner Solution

**RESPONSIBILITY:** Quality Engineer

**STANDARD:** Tank 12 and Containment Area must be checked daily to ensure integrity. Sufficient room must be maintained in Tank 12 to avoid overflow of Tank 12. The diked containment area must be monitored daily and any liquid in the containment area must be removed within 24 hours of detection in accordance with the Tank 12 Secondary Containment Dike Level Management procedure. Required information must be recorded on the spreadsheet; the spreadsheets and records of any pH testing must be kept for at least three (3) years.

#### **MEASUREMENT REQUIREMENTS:**

- Tank: EMC Graphic 239 will display Tank 12 and display the Tank level in Inches. EMC Historical Trend 6 will show you the how fast you are gaining or losing level in Tank 12 by displaying a Trend.
- Containment Area: Daily visual observation for presence of liquid. pH to be measured if any liquid in containment area. Visual observation and any pH reading to be recorded on the spreadsheet.

#### **REPORTING REQUIREMENT:** EMC Audit, Lab Report, Shift Supervisor

- Tank 12 must be inspected daily to leaks or cracks. Any leaks or cracks must be recorded on the spreadsheet and immediately reported to the Shift Supervisor. If no leaks or cracks, "OK" should be noted in the Visual Inspection section of the spreadsheet.

Tank 12 Level will be monitored and recorded on EMC once per shift using Graphic 239 and manually dipped on 2<sup>nd</sup> and 3<sup>rd</sup> Turn. You must notify the Shift Supervisor when going to manually stick Tank 12. The Shift Supervisor must be present to take a stick reading. If stick reading is more then 3" off compared to

EMC, you must notify the Shift Supervisor and the Electrical Department to have the Level Probe recalibrated.

- Monitor Flow into Tank 12 using EMC Historical-Trend 6.
- Enter the EMC level of Tank 12 into the Spreadsheet, Once per shift.
- Visually inspect the Containment Area once per shift for cracks, leaks or deterioration in the liner. Also note the presence of liquid in the Containment Area. If any cracks, leaks, deterioration or liquid level are present, notify the **Shift Supervisor**. If liquid level is present, obtain a sample and measure the pH. Record all information on the spreadsheet (level, pH and integrity inspection). If no items during visual inspection, "OK" should be noted in visual inspection section of spreadsheet.

**CORRECTIVE ACTION - TANK:** Notify the Shift Supervisor. Call waste hauler to remove contents of tank after taking the proper measurements.

- From Monday through Friday, when EMC shows that Tank 12 level has reached 100"; transportation must be contacted to remove the material.
- On Saturday and Sunday if the EMC shows that Tank 12 level has reached 160"; transportation must be contacted to remove the material.
- When the hauler arrives to remove material from Tank 12, hauler will notify QE, and tank levels will be verified prior to any offloading.
- Once the offload is completed, tank levels will be re-verified, and the dike area must be inspected for any spills. Only then can the QE sign any related paperwork to release the driver.

**CORRECTIVE ACTION – CONTAINMENT AREA:** Notify the Shift Supervisor. Material in containment area to be removed in accordance with Tank 12 Secondary Containment Dike Level Management procedure.

**SERIOUSNESS: MAJOR**

# **TANK 12 LEVEL PROBE CHECK OUT PROCEDURE DESCO REPETITIVE MAINTENANCE**

**File #100 & #101**

**April 21, 2006**

1. Don all necessary PPE in order to work with potentially hot and caustic liquid.
2. Go to Tank #12 located at the North End Tank Farm, east of the Terminal Building.
3. Verify tank is not already in an overflowing condition.
4. Check level of HCD trench located beneath the entry section of the line between columns C17, C18, & C19.
5. Check level of sump pit located at north side of column C17.
6. Check to see both North and South air operated Sandpiper pump valves are in the on position.
7. Check that alarm for trench located at operator station for pumps P-#68 & P-#69 is off and the red strobe is not activated.
8. Locate the north trench float limit switch due East from C18 at the edge of the trench. Then, pull the float from within trench and tilt into the upright position to activate alarm siren and strobe light. The alarm and siren should each silence itself when the float is returned to proper location and orientation.
9. Locate the south float limit switch due South about 12 feet from C18 at the edge of the trench. Then, pull the float from within trench and tilt into the upright position to activate alarm siren and strobe light. The alarm and siren should each silence itself when the float is returned to proper location and orientation.
10. Go to the HCD trench sumps on north side of column C17 to check level. If there is no solution level and pumps are not cycling it will be necessary to manually add level to activate ground-wire float system. Add water until both pumps are activated.
11. Go to Tank #12 while the pumps are still transferring solution to the tank. It will be necessary to climb to the top of the tank and locate the 6-inch flanged access opening for the tank float level switches. When the floats have been located and while the pumps continue to transfer, pull the flange out of the tank. Pull the "BLUE" colored float out of the tank and tilt into the upright position to de-activate the sump pumps. Verify no additional solution is entering the tank. Any pump, which was operating, should re-activate itself when the float is returned to proper location and orientation.
12. Pull the "BLACK" float from within the Tank and tilt into the upright position to activate alarm siren and strobe light located on the top of Tank #12. There is also a secondary alarm siren and strobe light located within the Terminal Building at column C15. The alarm and siren at each location should each silence itself when the float is returned to proper location and orientation.
13. Record findings and corrective actions, if necessary, on attached form and submit to the DESCO Maintenance Coordinator for recordkeeping.

RE: Aboveground Storage Tank (AST) & Containment Integrity Audit  
HCD Cleaner Tank #12 and Centrifuge Sludge Tank  
SME Project No. PE52677

Dear Mr. Carnevale:

SME has completed an integrity audit of the referenced above ground storage tank (AST) system, including the secondary containment system, as requested. The tank system was evaluated in accordance with the U.S. Environmental Protection Agency (EPA) Resource Conservation and Recovery Act (RCRA) hazardous waste storage tank regulations found in 40 CFR 265 Subpart J which requires an inspection by an independent, qualified, registered professional engineer and written report attesting that the system has sufficient structural integrity and is acceptable for storing the hazardous waste.

SME understands the following regarding the referenced tank system:

- The main tank (Tank #12) is 20,000 gallons in capacity and is located in the Waste Liquid Tank Farm located north of the North Motor Room. There is also a centrifuge sludge tank (1,000 gallons) within the containment, which is out of service.
- Tank #12 contains recoverable caustic (HCD Cleaner) regulated as a hazardous waste under RCRA prior to shipment off-site for recovery. The Centrifuge Sludge Tank formerly contained caustic material.
- A new interior liner system has recently been installed within the secondary containment system which is a Ceilcote 505 Coroline Resin-based material with a fiberglass mat. The walls of the secondary containment system are of masonry construction with interior and exterior coating systems..

© 2006 soil and materials engineers, inc.

consultants in the geosciences, materials, and the environment

In accordance with our Scope of Services, SME conducted an initial visual review with limited pachometer testing of the exterior wall, obtained and reviewed drawings of the containment structure, obtained and reviewed Material Safety Data Sheets (MSDSs) for the liner system and the tank contents, conducted visual and ultrasonic testing of the AST's, evaluated the structural integrity and volume of the secondary containment, and interviewed staff regarding inspection procedures.

## **1.0 Assessment of Existing Tank System's Integrity**

### **1.1 Design Standards for Tank Construction**

SME did not observe a manufacturers identification plate on either of the AST's. Based on our observations, the tanks were factory fabricated and delivered to the site complete, thus they fall under the STI standards for factory fabricated units under 50,000 gallons.

### **1.2 Hazardous Characteristics of the Wastes**

Tank #12 contains recoverable caustic (HCD Cleaner) prior to shipment off-site for recovery and may contain low concentrations of dispersants and oils containing non-volatile water miscible ethers that may be picked up in the cleaning process. The Centrifuge Sludge Tank formerly contained caustic material.

### **1.3 Existing Corrosion Protection Measures**

The ASTs are situated on concrete pedestals within the secondary containment system. Tank #12 has been primed and topcoated with a protective coating to prevent corrosion of the exterior shell. This coating, while exhibiting chalking from exposure, remains effective, refreshing of the top coat should be anticipated in 4 to 5 years. The Ceilcote containment lining was terminated at the top of the pedestal and was not carried over the edge to the foot of the tank. To prevent water penetration between the tank bottom and the pedestal, the liner should be carried to the foot of the tank and the intersection between the tank bottom and the liner sealed with a poly-sulfide sealant.

The Centrifuge Sludge Tank is jacketed with a sprayed-on polyurethane foam insulation. The top coating on the foam appears to be an acrylic material. With the abandonment in place of this unit no additional corrosion protection considerations are required at this time.

### **1.4 Tank Integrity Examination**

An AST tank audit report for Tank #12 is included as Attachment 1. The AST SP-001 audit was conducted on-site by Matt Baker, CWI, STI, NDT-L II (UT) and Brian Iglewski, CWI, NDT-L II (UT).

### **1.5 Centrifuge Sludge Tank Out of Service Assessment**

The centrifuge sludge tank is no longer connected to plant process equipment and has been "abandoned in place" in the containment basin. As such, an assessment was not made of this tank.

## **2.0 Secondary Containment Evaluation**

### **2.1. Design and Construction**

It appears that the containment system is constructed of concrete masonry unit (CMU) walls, and based on the pachometer test, the walls contain steel reinforcement. Structural assessment of the secondary containment wall utilizing the Michigan Building Code Section 2107 Working Stress Design standards for masonry walls was completed to assess whether the system has sufficient strength and thickness to prevent failure due to pressure gradients.

The CMU walls were analyzed using the MBC and ACI 530. The design is capable of withstanding the pressure of the fluid with a level equal to the top of the containment wall. Minor cracking was observed in the wall's structure which is judged to not impact the wall's ability to carry the design load.

### **2.2 Liner**

A new liner system was installed on the interior surface of the containment system utilizing a Ceilcote 505 Caroline Resin material with a fiberglass mat. Based on the materials brought on-site by the installer, it appeared a layer of Primer Resin and a Lining Basecoat were also applied over the existing liner materials. SME reviewed MSDS's for the new liner system and the tank contents. The liner materials were epoxy resin-based and MSDS's reviewed included:

- Ceilcote 680 Resin Primer,
- Ceilcote 505 LSE Ceilgard
- Ceilcote 664 Ceilguard Resin,
- Ceilcote S-1 Powder,
- Fiberglass Cloth, Mat, or Flake,
- Dur-A-Gard Regular Hardener, and
- Methyl Ethyl Ketone.

The tank contents were primarily sodium hydroxide-based HCD Cleaner with low concentrations of dispersants and oils containing non-volatile water miscible ethers that may be picked up in the cleaning process. The MSDS's reviewed included:

- Ferrocote EGL 1 DE,
- Formula 618 DE,
- Formula 503 20, and
- Quaker Formula 613 DPD.

Based on the review of the MSDS's, the liner material is compatible with the hazardous materials contained in Tank #12.

Some deterioration was observed on the pre-existing exterior coatings during the assessment. By coating/lining both sides of the CMU block, moisture which enters the block materials from below grade will be unable to escape, potentially causing damage to the exterior coatings. SME recommends daily inspection for bubbling or cracking of the exterior coating be added to the maintenance inspection program and that existing deterioration of the coating be repaired.

### **2.3 Foundation**

The foundation for the secondary containment, or the pedestal, was not visible for inspection. Review of the above grade foundation walls and the support pedestal showed no distress which would indicate potential failure of the foundation system of the secondary containment components.

### **2.4 Release Detection**

The ASTs are situated on concrete pedestals within the secondary containment system and are not pressurized. Double Eagle Steel conducts daily inspections of the tank systems at the facility and the pH is measured prior to discharging the storm water from the subject containment area. SME reviewed two documents utilized by Double Eagle Steel staff in their daily inspections (RCRA Visual Daily Hazardous Storage Tank Inspection) and when emptying storm water from the containment system (Tank 12 Secondary Containment Dike Level Management). As such, leaks from the ASTs would be detected within 24 hours due to the daily inspections conducted at the facility.

### **2.5 Containment Volume**

The containment volume of the secondary containment basin is 24,910 gallons, larger than the 20,000 gallons required. The actual calculated volume has not made allowance for the slight (less than 6") variation in bottom elevation and protrusions, however these values will not significantly impact the contained volume below the required value.

### **3.0 Ancillary Equipment**

Ancillary equipment is located within the containment area which abuts the building. The AST's are not pressurized, and there are no sealless or magnetic coupling pumps or valves associated with the AST systems. Double Eagle Steel conducts daily inspections of the tank systems at the facility, including ancillary equipment.

### **4.0 Recommended Repairs**

See Attachment 1 for a list of recommended repairs for this tank system. SME also recommends daily inspection for bubbling or cracking of the exterior coating be added to the maintenance inspection program and that existing deterioration of the coating be repaired.

### 5.0 Professional Engineer Statement and Signature

Based on the assessment, in SME's professional opinion, the existing tank system, once recommended repairs outlined herein are made, is adequate to contain the hazardous materials stored within Tank #12 and the secondary containment system is sufficient to contain a release.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

**Above Ground Storage Tank Audit (AST)**  
**Vertical Tank Audit and Site Assessment**

SME Project No. PE52677  
Date of Assessment: May 22, 2006  
Performed By: Mathew Baker, CWI, AST, NDT-LII and  
Brian Iglewski, CWI, NDT-LII  
Tank Owner: Double Eagle Steel Coating Company  
Project Site: 3000 Miller Road, Dearborn MI 48120

Seismic Zone: 1

**TANK IDENTIFICATION:**

VESSEL NO. Waste Tank No.12 SERIAL NO. Not Marked  
MANUFACTURER / SERVICE DATE: CBI – 1990 by Design Drawings  
ERECTOR: Not Provided  
DESIGN CODE: Not Marked – Factory Manufactured – AWWA Design and STI Inspection Standards  
CAPACITY: 20,000 gal RODUCT Electrolytic HCD Waste Water  
PRODUCT SPECIFIC GRAVITY 1.0 Estimated  
DESIGN - TEMPERATURE Ambient PRESSURE Atmospheric – Non-Pressurized  
CORROSION ALLOWANCE / RATE: None Provided

LEAK DETECTION SYSTEM: Visual

LAST SERVICE DATE: 1990 Estimated no records available

CATHODIC SYSTEM: None

**TANK INSPECTIONS**

Weekly Visual Inspection By: Double Eagle Steel Coating Company  
Monthly Visual Inspection By: Double Eagle Steel Coating Company  
Yearly Visual Inspection By: Double Eagle Steel Coating Company

HISTORY: No records provided. Plant has no records of leaks reported or other concerns with the unit.

PREVIOUS API / STI INSPECTION: None since erection.

**TANK CHANGE IN SERVICE OR OPERATION**

HISTORY: No change in service for unit since erection.

**TANK REPAIRS**

HISTORY: No records or knowledge by maintenance for any repairs or modifications to the shell of the unit.

### TANK DIMENSIONS:

TYPE of UNIT: STI - Vertical Base Set with Anchor Bolts

DIMENSIONS: Diameter: 15'-0"  
Height 17'-0" vertical Shell with 2'-6" domed self supporting roof.  
Shell Material: Steel  
Shell Nominal Thickness: 0.375"  
Capacity: 20,000 gal.

TOP/HEAD Type: 2'-6" domed self supporting roof  
Head Material: Steel  
Nominal Thickness: 0.375"

FOUNDATION: Type: Elevated Concrete Pedestal inside the Secondary Containment Area. Pedestal is 4'-1-1/2" above the bottom of the containment.  
Material: Cast In Place Concrete  
Dimensions: Detail on drawing C-1076 Trimark Project no. 89-134-360  
Width Octagonal 17'-3" in cross dimension with 7'-0" faces and 4'-1-1/2" in height

General Condition: The vertical surfaces of the pedestal have been covered by a fiberglass reinforced liner which terminates at the top edge of the unit. The horizontal surface is not covered by the liner materials and appears to be sound with no visible cracks, settlement, or other visual distress. The tank base is set directly on top of the pedestal and is not sealed to the concrete. To provide proper containment the liner should be extended to the edge of the tank and the tank base sealed to the liner with a polysulfide based sealant.

### SHELL PENETRATIONS

THE ACCESSWAYS AND PENETRATIONS FOR VALVES AND MONITORING EQUIPMENT ARE NOTED ON THE FOLLOWING DETAIL AND DESCRIBED IN THE SECTIONS WHICH ALSO FOLLOW:

### ACCESS MANWAYS

TYPE / SIZE: Vertical access is provided by a 24" diameter manway located on the north side of the shell, centered 30" off the bottom of the tank. The hatch is a circular, bolted flange design. The access is not posted with confined space entry signage as required by OSHA. The exposed gasket materials are weathered and there are two bolts which have not been tightened which are located inside the hatch hinge section.

The single access for entering the tank shell from the roof is a manhole centered in the top of the roof and penetrating through the manway walk on the top of the unit. The hatch is 24" in diameter with an 18" raised collar and bolted flange cover. The hatch cover has no bolts to secure the manway with the cover set on the opening

### FILL / DISCHARGE VALVES - VERTICAL FACES

TYPE / SIZE: Abandon 10" valve without blind flange on the ESE face of the shell 24" above the bottom of the tank. Valve exhibits residues from product and should be blanked off

TYPE / SIZE: Three abandon 3" valves without blind flanges on the SW face of the shell starting 24" to 48" above the bottom of the tank. Valves exhibit residues from product and should be blanked off.

TYPE / SIZE: 2" active drain valve on the SW face of the shell 18" above the bottom of the tank. Valve has quick disconnect fittings and is active.

TYPE / SIZE: 6" inactive drain valve on the NNE face of the shell 6" above the bottom of the tank. Valves exhibit residues from product and should be blanked off.

TYPE / SIZE: 2" inactive nozzle with blank on the WNW face of the shell 6" above the bottom of the tank.

TYPE / SIZE: 2" active Temperature nozzle on the West face of the shell 6" above the bottom of the tank.

TYPE / SIZE: Two active 3" valves on the West face of the shell starting 24" above the bottom of the tank.

### FILL / DISCHARGE VALVES - TOP OF UNIT

TYPE / SIZE: Active 8" fill riser on flange located on the south side of the roof.

TYPE / SIZE: Active 8" flanged nozzle with two lines penetrating the blanked top – one each of a 2" and 1" line from the building. Nozzle is 12" west of the 8" fill line.

TYPE / SIZE: The vent line is a 4" gooseneck on the west half of the roof with a 36" rise from the top of the tank. Vent is not screened.

TYPE / SIZE: Two active 6" nozzles located in the roof which penetrate the landing have instrumentation for monitoring the tank

### NONDESTRUCTIVE TESTING

#### SHELL THICKNESS

The typical vertical tank is supported by bearing directly on the full bottom, bearing on an octagonal pedestal located within the secondary enclosure. The shell was evaluated using the B-scan Ultrasonic testing methods. The codes require a minimum of 15 readings in each one square foot. This is achieved by setting the B-scan to record every 0.25" of linear travel and scanning with a diagonal pattern the complete square foot surface of the tank. The following sketch presents the locations of the scans which were equally spaced around the perimeter of the tank.

### Vertical Shell – UT Scan Runs

The actual B-Scan Summary sheets and B-Scan readouts summarizing the readings are attached to this report.

### COATING THICKNESS

The exterior of the tank has a coating of which thickness measurements were 15.0 to 20.0 mils DFT. The coating is well bonded and performing as intended with the surfaces exhibiting medium chalking. The coatings should be scheduled for refreshing after 3 to 4 years of additional service.

### GENERAL TANK CONDITIONS:

The tank is generally in good condition with minimal corrosion concerns and based on the STI criteria of SP-001-03 the tank meets the criteria for an additional recertification of 5 years. There are six maintenance items which should be corrected or addressed on this unit.

- A. All abandoned valves should be locked out and blanked off.
- B. Secure lockouts should be installed on active valves to prevent opening by unauthorized staff.
- C. The liner for the containment should be extended over the top of the pedestal and sealed to the tank bottom with polysulfide sealant materials.
- D. Signage for confined space entry should be applied to all manways on the unit. Also loose bolts on the vertical manway should be tightened and bolts provided to secure to manway on the roof of the tank.
- E. The ladder into the containment should be replaced or repaired.
- F. The platform and railing will require minor paint repairs to prevent corrosion.
- F. Repair the deterioration of the exterior containment wall coating and add exterior coating to visual inspection program.

TO: LINE OPERATORS  
QA LAB  
SHIFT SUPERVISORS

WHEN PUMPING OUT HCD CLEANER RECIRC TANK TO TANK 12, YOU MUST VERIFY WITH THE QUALITY ENGINEER OR LINE OPERATOR THAT THE LEVEL IN TANK 12 IS NOT GREATER THAN 85 INCHES. IF THE LEVEL IS GREATER THAN 85 INCHES THE TANK WILL OVERFLOW. A TRUCK MUST BE ORDERED AND MATERIAL REMOVED FROM TANK 12 TO REDUCE THE LEVEL TO BELOW 85 INCHES BEFORE THE HCD CLEANER CAN BE PUMPED TO TANK 12.

Subject: Spill of Hydraulic Oil -- January 5, 2006  
NPDES Permit No. MI 0044415  
Double Eagle Steel Coating Company

Dear Wayne County Emergency Management Personnel:

This is Double Eagle Steel Coating Company's (DESCC) 10 day notification letter regarding a spill of an unknown, small quantity of hydraulic oil that entered our storm water system. DESCSC became aware of a hydraulic oil spill at 11:40 a.m. on Thursday January 5, 2006. Containment and cleanup began immediately. An investigation was initiated. A hydraulic oil hose failed on a truck while the truck was attempting to load a roll off box in a paved parking area. The truck belongs to our solid waste (trash/debris) hauler, Technical Logistics Co. of Romulus, Michigan. The driver reported that approximately 35 to 40 gallons of oil leaked. Before spill containment could be accomplished, a small quantity of oil entered our storm water system. Tracy Keckskemeti of MDEQ's Water Bureau was notified approximately 4:45 p.m. by voice mail. PEAS and the NRC (report number 784387) were notified approximately 5:00 p.m. The US Coast Guard was notified approximately 5:15 p.m. A return call from USCG (Bryce Bane) was received approximately 5:20 p.m. Ms. Keckskemeti called Christopher McBee of DESCSC about 6:30 p.m. after being notified by PEAS; she was briefed on the situation.

The storm drain was blocked immediately upon notification of the spill and the area was secured. DESCSC immediately deployed tethered spill containment socks into catch basins downstream of the spill. Concurrently, spill cleanup and containment assistance was requested from Vac-All Services (industrial clean up contractor).

Vac-All skimmed oil as it entered the first downstream catch basin. Surface cleanup commenced with power washing / vacuuming of the spill material. A street sweeper swept the roadway of any oil that was tracked beyond the immediate spill area. After the surface was cleaned, Vac-All jetted the sewer from the immediate downstream catch basin back to the catch basin that the oil drained to. Both catch basins were vacuumed completely.

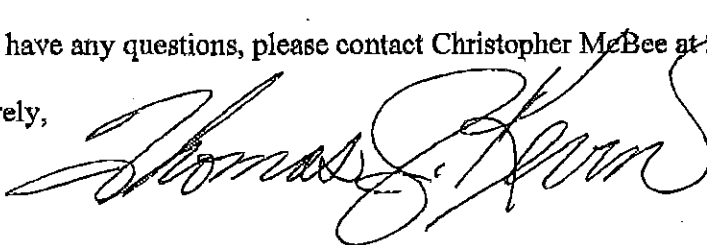

Visual inspection of our storm water monitoring point (Outfall 200) did not indicate any evidence of oil. DESCSC believes, with high confidence, that nothing left our site or entered the environment.

There were no fatalities or injuries associated with this release.

Double Eagle is notifying the waste hauler of its responsibility to maintain its equipment and to train its employees in spill response.

If you have any questions, please contact Christopher McBee at 313-203-9829.

Sincerely,

A handwritten signature in black ink, appearing to read "Thomas L. Kevin". The signature is fluid and cursive, with a large, sweeping loop at the end.

Subject: Spill of Hydraulic Oil – January 5, 2006  
NPDES Permit No. MI 0044415  
Double Eagle Steel Coating Company

Dear Environmental Assistance Division:

This is Double Eagle Steel Coating Company's (DESCC) 10 day notification letter regarding a spill of an unknown, small quantity of hydraulic oil that entered our storm water system. DESCSC became aware of a hydraulic oil spill at 11:40 a.m. on Thursday January 5, 2006. Containment and cleanup began immediately. An investigation was initiated. A hydraulic oil hose failed on a truck while the truck was attempting to load a roll off box in a paved parking area. The truck belongs to our solid waste (trash/debris) hauler, Technical Logistics Co. of Romulus, Michigan. The driver reported that approximately 35 to 40 gallons of oil leaked. Before spill containment could be accomplished, a small quantity of oil entered our storm water system. Tracy Kecskemeti of MDEQ's Water Bureau was notified approximately 4:45 p.m. by voice mail. PEAS and the NRC (report number 784387) were notified approximately 5:00 p.m. The US Coast Guard was notified approximately 5:15 p.m. A return call from USCG (Bryce Bane) was received approximately 5:20 p.m. Ms. Kecskemeti called Christopher McBee of DESCSC about 6:30 p.m. after being notified by PEAS; she was briefed on the situation.

The storm drain was blocked immediately upon notification of the spill and the area was secured. DESCSC immediately deployed tethered spill containment socks into catch basins downstream of the spill. Concurrently, spill cleanup and containment assistance was requested from Vac-All Services (industrial clean up contractor).

Vac-All skimmed oil as it entered the first downstream catch basin. Surface cleanup commenced with power washing / vacuuming of the spill material. A street sweeper swept the roadway of any oil that was tracked beyond the immediate spill area. After the surface was cleaned, Vac-All jetted the sewer from the immediate downstream catch basin back to the catch basin that the oil drained to. Both catch basins were vacuumed completely.

Visual inspection of our storm water monitoring point (Outfall 200) did not indicate any evidence of oil. DESCSC believes, with high confidence, that nothing left our site or entered the environment.

There were no fatalities or injuries associated with this release.

DON Bodurie

\*For a list of NAICS codes, please refer to Section 8 of the EQ Resource Guide.

**Section 2 - Shipping & Packaging Info**

- 2.1) Shipping Volume & Unit: 2800 pounds Frequency: One Time Only  
 2.2) DOT Shipping Name: Non-Hazardous  
 2.3) Is this waste surcharge exempt? ☐ Yes ☒ No (If you answered "Yes" to question 2.3, select the Surcharge Exemption reason.)

**2.4) Packaging (check all that apply)**

- ☐ Bulk Solid (yd  $\leq$  2000 lbs./yd  $^3$ ) ☐ Bulk Solid (Ton > 2000 lbs./yd  $^3$ ) ☐ Bulk Liquids (Gallon)  
☐ Totes, Size ☐ Cubic Yard Boxes/Bags ☒ Drums, Size 700 pound  
☐ Other (palletized, 5 gal. Pail, etc.)

Quoted bulk disposal charges for solid materials will be billed by the cubic yard, if the waste density is less than 2,000 lbs./cubic yard. If waste density is greater than 2,000 lbs./cubic yard, then bulk disposal charges will be billed by the ton, regardless of the approved container.

**Section 3 - Physical Characteristics**

- 3.1) Color: BLACK, VARIES 3.2) Odor: none  
 3.3) Does this waste contain any "Potentially Odorous Constituents" as defined in the EQ Resource Guide? (Section 3) ☐ Yes ☒ No  
 3.4) Physical State at 70 °F: ☒ Solid ☒ Dust/Powder ☐ Liquid ☐ Sludge  
 3.5) What is the pH of this waste? ☐  $\leq 2$  ☐ 2.1-4.9 ☒ 5-10 ☐ 10.1-12.4 ☐  $\geq 12.6$   
 3.6) What is the flash point of this waste? ☐  $< 90$  °F ☐ 90-139 °F ☐ 140-199 °F ☒  $\geq 200$  °F  
 3.7) Does this waste contain? (check all that apply) ☒ None ☐ Free Liquids ☐ Oily Residue ☐ Metal Fines  
☐ Biodegradable Sorbents ☐ Amines ☐ Ammonia ☐ Water Reactive ☐ Biohazard ☐ Aluminum  
☐ Shock Sensitive Waste ☐ Reactive Waste ☐ Radioactive Waste ☐ Explosives ☐ Pyrophoric Waste ☐ Isocyanates  
☐ Asbestos - non-friable ☐ Asbestos - friable ☐ Dioxins ☐ Purans

**Section 4 - Composition / Generating Process**

- 4.1) Describe the physical composition of the waste (i.e., soil, water, PPE, debris, key chemical compounds, etc.)  
 Debris from 0% to 25%  
 PPE from 0% to 25%  
 Sand from 50% to 100%  
 4.2) Provide a detailed description of the process generating this waste. (attach flow diagram if available).  
 Cleanup of a residential cleaning job.

**Section 5 - Is This Hazardous Waste?**

Please refer to Section 5 of the EQ Resource Guide for a list of waste codes.

As determined by 40 CFR, Part 261 and Michigan Act 451 Rules:

Please list applicable waste code(s):

- 5.1) Is this an EPA RCRA listed hazardous waste (F, K, P or U)? ☐ Yes ☒ No  
 Comments:  
 5.2) Is this an EPA RCRA characteristic hazardous waste (D001-D043)? ☐ Yes ☒ No  
 Comments:  
 5.3) Do any State Hazardous Waste Codes apply? ☐ Yes ☒ No  
 Comments:  
 5.4) Is this waste intended for wastewater treatment? ☐ Yes ☒ No

If you answered "No" to questions 5.1, 5.2, and 5.3, please skip to Section 7.  
 If you answered "Yes" to question 5.4, please complete the WCR Addendum.

## Section 6 - Hazardous Wastes

6.1) Does this waste exceed Land Disposal Residuation Levels?☐ Yes ☒ No

6.1a) If this waste stream is greater than 50% soil, does it meet the alternative soil treatment standards of 40 CFR 268.49?

☐ Yes ☒ No

6.1b) Does this waste contain greater than 50% debris, by volume? (Debris is greater than 2.5 inches in size.)

☐ Yes ☒ No

6.2) Is the waste an oxidizer (D001)?

☐ Yes ☒ No6.3) Does this waste contain reactive cyanide  $\geq 250$  ppm (D003)?☐ Yes ☒ No6.4) Does this waste contain reactive sulfide  $\geq 500$  ppm (D003)?☐ Yes ☒ No

6.5) Please indicate which constituent concentrations are below or above the regulatory level. Please indicate the basis used in the determination. Either 'Below' or 'Above' MUST be checked for each constituent.

Based On: ☒ Generator Knowledge ☒ Analysis☐ MSDS\*

\*Please forward a copy. Analysis or MSDS are required for EQ Florida Non-hazardous wastes.

Code	Regulatory Level	TCLP (mg/l)	Concentration (if above)
D004	Arsenic	5	<input checked="" type="radio"/> Below <input type="radio"/> Above

D043	Vinyl Chloride	0.2	<input checked="" type="radio"/> Below <input type="radio"/> Above

6.6) If this is a characteristic hazardous waste, does it contain underlying hazardous constituents?

☐ Yes ☒ No

If you answered 'Yes', please list the constituents in Section 11.

## Section 7 - Non-Hazardous Wastes

For a complete list of non-hazardous waste codes, please refer to Section 7 of the EQ Resource Guide.

Applicable waste code(s):

7.1) Is this a Michigan non-hazardous liquid industrial waste?☐ Yes ☒ No

Comments:

7.2) Is this a Universal waste?☐ Yes ☒ No7.3) Is this a Recoverable Commodity? (e.g.: computer monitors, free mercury, etc.)☐ Yes ☒ No

7.4) Is this waste a recoverable petroleum product?

☐ Yes ☒ No

7.5) Is this waste used oil as defined by 40 CFR Part 279?

☐ Yes ☒ No

**Section 8 - TSCA Information**

- 8.1) What is the concentration of PCBs in the waste? ☒ None ☐ 0-5 ppm ☐ 6-49 ppm  
☐ 50-499 ppm ☐ 500+ ppm
- 8.2) Does the waste contain PCB contamination from a source with a concentration  $\geq 50$  ppm?  
 If you answered "None" to 8.1 and "No" to 8.2, please skip to Section 9. ☐ Yes ☒ No
- 8.3) Has this waste been processed into a non-liquid form?  
 If yes, what was the concentration of PCBs prior to processing? (ppm) ☐ Yes ☒ No  
☒ N/A ☐ 0-499 ☐ 500+
- 8.4) Is the non-liquid PCB waste in the form of soil, rags, debris, or other contaminated media? ☐ Yes ☒ No
- 8.5) Are you a PCB capacitor manufacturer or a PCB equipment manufacturer? ☐ Yes ☒ No
- 8.6) Has the PCB Article (e.g., transformer, hydraulic machine, PCB-contaminated electrical equipment) been drained/flushed of all PCBs and decontaminated in accordance with 40 CFR 761.60(b)? ☐ N/A ☐ Yes ☒ No

**Section 9 - Clean Air Act Information**

- 9.1) Is this waste subject to regulation under 40 CFR, Part 63, Subpart DD or 40 CFR, Part 264, Subpart CC (RCRA)? ☐ Yes ☒ No  
 (Does the waste contain  $>800$  ppm Volatile Organic Hazardous Air Pollutants - VOHAP's or Volatile Organic Compounds - VOC's?)  
 For a complete list of VOHAP's, please see Section 11 of the EQ Resource Guide.
- 9.2) Is this site, or waste, subject to any other MACT or NESHAP?  
 If yes, please specify: ☐ Yes ☒ No
- 9.3) Does this waste stream contain Benzene?  
 If you answered "No" to question 9.2, please skip to section 10. ☐ Yes ☒ No
- 9.4) Does the waste stream come from a facility with one of the SIC/NAICS codes listed under the Benzene NESHAP identified in 40 CFR 61, Subpart FF? ☐ Yes ☒ No
- 9.5) Is the generating source of this waste stream a facility with Total Annual Benzene (TAB)  $\geq 10$  Mg/year?  
 For assistance in calculating the TAB, please see the TAB Worksheet in Section 5 of the EQ Resource Guide.  
 If you answered "No" to question 9.3 and 9.4, please skip to Section 10. ☐ Yes ☒ No
- 9.6) Does the waste contain  $> 10\%$  water? ☐ Yes ☒ No
- 9.7) What is the TAB quantity for your facility? \_\_\_\_\_ Mg/year
- 9.8) Does the waste contain  $>1.0$  mg/kg total Benzene? ☐ Yes ☒ No
- 9.9) What is the total Benzene concentration in your waste? \_\_\_\_\_ (concentration) \_\_\_\_\_ (unit)

(Supporting analysis must be attached. Do not use TCLP analytical results. Acceptable laboratory methods include 8202, 8240, 8260, 802 and 824.)

\*For a list of NAICS codes, please refer to section 9 of the EQ Resource Guide.

**Section 10 - Fuel Blending Information**

- 10.1) Is this waste intended for fuel blending? ☐ Yes ☒ No  
 If you answered 'Yes' to question 10.1, please enter the following:
- Heat value (BTU/lb.) \_\_\_\_\_  
 Chlorine (%) \_\_\_\_\_  
 Water (%) \_\_\_\_\_  
 Solids (%) \_\_\_\_\_
- 10.2) Is this waste intended for reclamation? ☐ Yes ☒ No (5-Gallon Sample required for all reclaim waste streams)

**Section 11 - Constituent Information**

Please identify your waste constituents from these four categories: Underlying Hazardous Constituents (UHC's), Volatile Organic Hazardous Air Pollutants (VOHAP's), Volatile Organic Compounds (VOC's) and Toxic Release Inventory Constituents (TRI)

Constituent	Concentration	UHC?
-------------	---------------	------

Please see Section 11 of the EQ Resource Guide for a list of UHC's, VOHAP's and VOC's. For a complete list of TRI constituents, please refer to 40 CFR 372.85.

**Section 12 - Certification**

I certify that all information (including attachments) is complete and factual and is an accurate representation of the known and suspected hazards, pertaining to the waste described herein. I authorize EQ's Resource Team to add supplemental information to the waste approval file, provided I am contacted and give verbal permission. I authorize EQ's Resource Team to obtain a sample from any waste shipment for purposes of verification. Generator or on Generator's behalf shall be subject to, and Generator shall be bound by, the attached Standard Terms and Conditions, and confirmation. I agree that, if EQ approves the waste described herein, all such wastes that are transported, delivered, or tendered to EQ by

Comments:

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations. If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment. If I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

**THIS SHIPPING ORDER**

must be legibly filled in, in Ink, in Indelible Pencil, or in  
Carbon, and retained by the Agent.  
RECEIVED, subject to the classifications, tariffs, and contracts in effect on the date of issue of this Shipping Order.

B/E No. **1639**AT **DEARBORN MI** FROM **HERSEY MI**

the property described below, in apparent good order, except as noted (contents and condition of contents of packages unknown), marked, consigned and destined as indicated below, which said carrier (the word carrier being understood throughout this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery at said destination, it on its route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed, as to each carrier of all or any said property over all or any portion of said route to destination, and as to each party at any time interested in all or any of said property, that every service to be performed hereunder shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in form Freight Classification in effect on the date hereof, if this is a rail or a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment.

Shipper hereby certifies that he is familiar with all terms and conditions of the said bill of lading, including those on the back thereof, set forth in the classification, tariff, or contracts which governs the transportation of this shipment, and the said terms and conditions are hereby agreed to by the shipper and accepted for himself and his assigns.

Subject to Section 7 of Conditions of Applicable bill of lading. If this shipment is to be delivered to the consignee without recourse on the Consignor, the Consignor shall sign the following statement:

The Carrier shall not make delivery of this shipment without Payment of freight and all other lawful charges.

(Signature of Consignor)
